Ethical Criterion of “Good” and “Bad”

Why a Criterion is Needed

When society argues about politics, economics, or technology, usually everyone says “this is right.”

The Code suggests not arguing only with slogans, but checking the consequences.

Basic Check

Good is what:

- strengthens the life and dignity of people;
- improves the quality of joint life, rather than the profit of a narrow group;
- leaves behind more order, trust, and opportunities.

Bad is what:

- is built on lies, humiliation, or exploitation;
- improves the lives of some at the expense of the degradation of others;
- leaves society with long-term destruction (conflict, fear, environmental destruction).

Three Questions before a Decision

1. **Who will be better off, and who will be worse off?**

If “profit at the top, damage at the bottom,” this is a warning signal.

2. **What will happen in 5-10 years?**

A decision should not look good only in a short horizon.

3. **Can this be openly explained to an ordinary person?**

If a decision is shameful to explain directly, it most likely has an ethical defect.

Psychology, Sociology, Law — in One Contour

- **Psychology:** people cooperate better when they feel respect and fairness.
- **Sociology:** society is stable when the rules are the same for everyone, not just for the weak.
- **Law:** an ethically strong decision must be legal, proportional, and verifiable.

Short Formula

If a decision improves the quality of life without dehumanization and does not destroy the future, it moves towards “good.”

If it is profitable today but breaks people and institutions tomorrow, it is “bad,” even with beautiful packaging.

Property as Responsibility

Main Idea

Property is needed by a person for life, freedom, and labor.

But in the Code, it is not considered “sacred in itself.” Its meaning is in responsible use, not in the right to harm others.

What this Changes

Ownership is justified if it:

- does not destroy the common space of life;
- does not turn basic goods into a tool of blackmail;
- helps to create, rather than block development.

Where the Boundary Lies

My house, my business, my tool — this is a zone of autonomy.

But air, water, safety, access to basic infrastructure — this is

already a common contour, where personal interest is limited by the public good.

Practical Principles

1. An unused resource should not rot.

If a resource is held without benefit and interferes with others, society has the right to a mechanism for returning it to circulation according to transparent rules.

2. Profit does not justify harm.

If property brings income at the cost of the degradation of the environment and people, this is a violation, not a “successful business.”

3. Responsibility is measurable.

The owner is responsible not only for the right to own, but also for the consequences of use.

Why this is Important for an Ordinary Person

Such an approach reduces cynicism: people see that the rules apply not only to the weak.

And this directly affects trust, safety, and readiness to cooperate.

Short Conclusion

Property in the Code is not a cult of ownership, but a form of agreement: you are given a right, you bear responsibility.

Capital as a Tool, not a Goal

What is the Problem with the Old Logic

When capital turns into an end in itself, society begins to evaluate people by the volume of accumulated wealth, rather than by the

quality of their contribution.

This encourages a race for numbers and weakens trust.

The Code's Approach

Capital is not a moral merit in itself.

It is a resource that must work for the development of people, infrastructure, knowledge, and sustainability.

The “Capital in Service” Principle

Capital is considered creative if it:

- expands access to a quality life;
- supports long-term socially useful projects;
- reduces chaos and injustice, rather than amplifying them.

Where the Imbalance is Visible

- there is profit, but the vulnerability of people and the environment is growing;
- innovation is presented as progress, but in fact it is squeezing rent;
- social costs are shifted to those who do not receive the benefit.

Practical Filter

Before launching a major financial decision, questions are asked:

1. What real problem for people does this solve?
2. Who bears the risks and who receives the benefit?
3. What will remain for society in 5-10 years, besides a financial report?

Short Conclusion

Capital in the logic of the Code is the energy of development. If it does not serve the common good, it loses ethical legitimacy.

Patents and Common Knowledge

Main Fork

Society needs both motivation for creators and quick access to useful knowledge.

If only monopoly is preserved, progress slows down. If authorship is ignored, the motivation to create falls.

The Code's Approach

Formula: **honor to the author, benefit to humanity.**

This means:

- the author receives recognition and fair remuneration;
- critically important knowledge is not blocked by rent for decades;
- public interest has priority where it concerns life, health, and basic safety.

Practical Principles

1. Transparency of the Innovation Source

It is clear what was created by a private team and what was built on public resources.

2. Fair Term of Exclusivity

The term should protect the developer's labor, but not turn into a mechanism for slowing down development.

3. Mandatory Access Mechanisms

For vital technologies, models of open licensing or regulated accessibility must work.

Risk that is Important to Avoid

When a patent is used not to protect labor, but to maintain scarcity, society pays a double price: in money and in lost development time.

Short Conclusion

A patent in the Code is a temporary tool for coordinating interests, not an absolute right to block socially important knowledge.

Boundaries of Freedom and Sanctions

Principle of the Boundary

Personal freedom is a basic value.

But it ends where a person's actions systematically destroy the safety, dignity, and living conditions of others.

What this Means in the Logic of the Code

- freedom does not equal the right to harm;
- the public good does not equal total control;
- sanctions are needed not for revenge, but to stop harm and restore justice.

When Restriction is Permissible

Restriction of a measure is permissible only if the following conditions are simultaneously met:

1. legality;

2. proportionality;
3. public transparency;
4. possibility of appeal;
5. limited and clear term.

Which Sanctions are Ethically Preferable

- correction of behavior and an obligation to eliminate harm;
- restriction of access to privileges if public trust is violated;
- restorative measures for victims.

Less preferable are measures that are only punitive but do not reduce the risk of recurrence.

Where the Risk of Abuse Lies

- vague formulations of “threat”;
- selective application of norms;
- punishing criticism instead of punishing real harm.

Short Conclusion

A mature system does not choose between “complete permissiveness” and “harsh suppression.”

It holds freedom and responsibility in one legal contour.

Manifesto of the Common Good

Why this Manifesto

We live in a common world where consequences do not remain local.

Therefore, mature ethics begins with a simple recognition: one cannot build personal well-being on the systemic destruction of the common home.

Basic Provisions

1. **Common good is the criterion for decisions.** A good decision improves the quality of life of people without degradation of the environment and dignity.
2. **Constructive action is more important than profit at any cost.** Economic success is not a moral argument if it is achieved through harm.
3. **Knowledge must spread.**
Sources, citation, and open updating of conclusions are a norm of development, not bureaucracy.
4. **Technology is subordinate to humanity.**
Progress is justified only where it reduces suffering and expands a dignified life.
5. **Freedom does not equal arbitrariness.**
Personal freedom ends where sustainable damage to others begins.

Social Contract of the Code

We recognize:

- the value of labor and care;
- the value of an honest public word;
- the value of an agreement instead of escalation;
- the value of national identity without enmity towards others;
- the value of human rights as the basis for sustainable development.

What this Means in Everyday Life

- in the family: respect, dialogue, responsibility for words and actions;
- in work: quality, honesty, refusal of manipulation;

- in society: participation, checking information, supporting fair rules;
- in politics: negotiability, transparency, long horizon.

Short Formula of the Manifesto

Truth instead of a convenient lie.

Constructive action instead of destructive action.

Dignity instead of dehumanization.

Common good instead of narrow profit.

Ethics of Cloning and Human Dignity

Why this Chapter

Cloning and related biotechnologies cannot be evaluated only on the principle of “can we or can’t we.” The main question of the Code: does it improve the quality of life of people and preserve human dignity.

Basic Ethical Principle

Not everything technically possible is ethically permissible. A person cannot become raw material, expendable material, or a commodity, even if it is economically profitable.

What can be Considered Socially Useful

- therapeutic biotechnologies for the treatment of serious diseases;
- restoration of body functions and reduction of suffering;
- research that undergoes independent ethical expertise and transparent public control;
- decisions that give long-term benefit to many, rather than profit to a narrow group.

Red Lines

- reproductive human cloning as an industry of “custom-made people”;
- selection of people based on profit, status, or market demand;
- biotechnological practices that amplify humiliation, discrimination, or social stratification;
- any decisions without voluntary informed consent and without the right to refuse.

Criterion of “Good/Bad” in this Topic

Good, if the technology:

- reduces pain and expands opportunities to live with dignity;
- does not destroy equal human dignity;
- does not turn vulnerable people into an object of exploitation;
- strengthens the common good and trust in society.

Bad, if the technology:

- commercializes human life as a product;
- consolidates a new biological elitism;
- normalizes the idea that a person’s value is determined by utility or price.

Principle of Constructive Action for the Sake of Quality of Life

Bioprogress is justified where it helps people live longer, healthier, and freer lives without destroying the moral framework of society. Constructive action without dignity is no longer development, but a technical form of destructive action.

Ethical Test of Technology: 7 Questions

This test is needed for a quick assessment of any technology: from AI and bioengineering to cloning models and new forms of automation.

How to Use

For each question, give an answer: “yes,” “partially,” or “no.” If there is at least one confident “no” in questions 1, 2, 3, or 5, the technology should not be scaled until the risk is eliminated.

7 Questions

1. **Dignity:**

Does the technology not turn a person into an object, raw material, or commodity?

2. **Common Good:**

Does it improve the quality of life not only of a narrow group, but of society as a whole?

3. **Fairness of Access:**

Does it not create a new form of biological or technological caste system?

4. **Voluntariness:**

Is there real informed consent and a right to refuse for the person without hidden punishment?

5. **Non-destruction of the Environment:**

Does the technology not destroy the natural and social living conditions of future generations?

6. **Transparency and Responsibility:**

Is it clear who makes decisions, who is responsible for errors, and how damage is corrected?

7. **Creative Outcome:**

Does the technology increase the space of freedom, development, care, and meaningful labor?

Interpretation of the Result

- **7 “yes”** -> technology can be implemented with regular public audit.
- **5-6 “yes” + “partially”** -> pilot mode, limited scale, mandatory revision.
- **Less than 5 “yes”** -> implementation is postponed until ethical failures are eliminated.

For the Topic of Human Cloning

The test does not block research “by default,” but strictly limits practices where human life loses dignity for the sake of profit, status, or market demand.
